Project [Advanced Diploma]

Module Description and Outcomes

Module Code	NRPJ740
Module Name	Project
Module Description	This module integrates the content of programming, software engineering and systems analysis and design. This includes the design and implementation of an appropriate industry-level project. The module aims to provide students with the skills required to conceptualise, produce and manage software development projects. Over the course of the advanced diploma, students will produce project work which will contribute to their professional portfolio and will be on par with the quality standards expected of professionals within industry. The project IV component has been designed in such a way that it builds on and is an articulation of the knowledge accumulated in Project I, II and III. Students move from acquiring project management skills in Project I, to teaming up in Project II to delivering a project, to Project III where they work on individual projects for their professional portfolios. The knowledge and skill sets of the three project years are then brought together in Project IV, with students needing to identify a need for a project that will contribute to industry and enhance the quality and integrity of their professional portfolios.
Learning Outcomes	• Demonstrate an acquisition of a structured view of the overall process of software development, with greater understanding of its main phases, specific notations and the specification and development tools employed. Choose and apply suitable technologies in construction of a service-oriented architecture. • Demonstrate the ability to structure a problem into natural components and evaluate critically a piece of analysis and

	development work. Understand the enterprise application interoperability. • Demonstrate an understanding of how to identify, select and apply appropriate methods and tools for the development of solutions to specific real-world problems. • Demonstrate an understanding of embedded system design and implementation. • Show and explain what it means to work effectively as part of a software development project team following a recognised development methodology, including the need to communicate effectively through written, oral and other forms of technical presentation. • Produce a project that is of quality and that can be benchmarked against industry standards. • Discuss, reflect and critically engage with the impact projects may have on users, society and structures; • Work effectively in a team – solve problems, use management technology, organise, manage and communicate effectively. • Be able to reflect feedback and evaluate their work and that of their peers
